

SERIES: VLD25-SMT | **DESCRIPTION:** LED DRIVER

FEATURES

- power LED driver
- wide input and output voltage range
- SMT package
- constant current output
- PWM dimming and analogue dimming
- short circuit protection
- analog dimming
- high efficiency up to 96%

APPLICATION NOTES

1. Digital Dimming Control

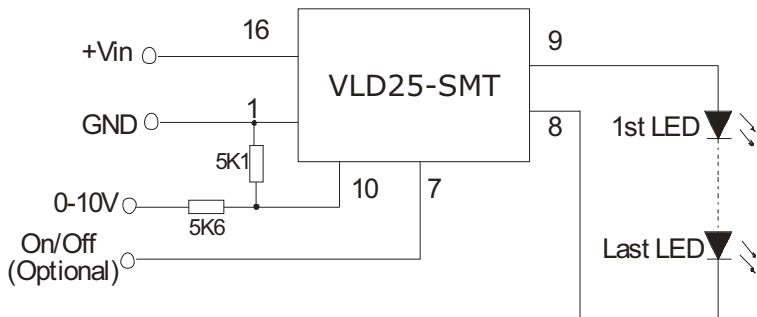

For the rated frequency PWM dimming, the output current of driver matters to the pulse width of the PWM signal, and the numerate please refer to the following formula:

$$I_{o,set} = \frac{(DT-0.6)}{T} I_{o,norm}$$

$I_{o,set}$ refers to the expected output current value.
 $I_{o,norm}$ refers to the rated output current
 D refers to the pulse width of the PWM signal
 T refers to the cycle of the PWM signal

Note: The formula only supplies as a reference, and the output current may be a little deviation with different load. The $T_{on(min)}$ of PWM signal must be greater than 0.7ms, or the driver can't be operated normally. It is natural for the driver to generate an audibly noise in dimming process, because the frequency of the control circuit is within human audibly range (20Hz~20kHz). In order to avoid the human eye can observe the LED flashes, the PWM dimming frequency is recommended to set above 100Hz.

3. EMC Recommended Circuit

EMI/RFI conducted EN55022 recommended circuit

EMI/EMC recommended circuit

- Notes: 1. DIM pin is the module's PWM dimming pin
2. While adding circuit, it may extend the PWM dimming output reaction time
